

• Cabbage are widely adapted to a wide range of weather conditions hence they can be grown throughout the year in most regions

CLIMATIC REQUIREMENTS

• Optimum temperature for growth and development is between 18 - 20 degrees Celsius, it is fairly resistant to frost and can survive at very low temperatures without damage.

SOIL CONDITIONS

- · Cabbage thrives in well drained moisture retentive loamy soils well supplied with organic matter
- Ideal soil pH ranges from 5.5 6.5.

POPULATION AND SPACING

- Population of a hectare ranges between 40 000 45 000 plants/Ha and 55 000 65 000 depending on the cultivars
- For baby cabbage, population of between 80 000 100 000 per Ha are recommended
- Plant spacing; Large headed cultivars 60 70 cm between rows and 45 cm within rows
- Small to medium headed cultivars, 60 cm between rows and 30 cm within rows

When spraying, approximately 12.5 * 16 litre knapsacks will cover 1 hectare. That makes 200liters. IT IS ADVISABLE THAT SOIL TESTS BE DONE BEFORE PLANTING.

| DAMPING OFF | Copper Oxychloride | 3-7Kg | Repeat at 7-10day intervals when necessary |

THIS IS A RECOMMENDATION

• Maize is widely adapted to a wide range of weather conditions, but susceptible to frost.

CLIMATIC REQUIREMENTS

• Maize is best grown in temperatures between 18°C and 27°C during the day and around 14°C during the night

SOIL CONDITIONS

- Maize thrives in well drained soils with rooting depth of 45-60cm
- Ideal soil pH ranges from 5.5 6.5

POPULATION AND SPACING

- Maize generally requires about 25 kgs of seed, specifically varies with variety, planting time, farming region
- Plant population; 45 000 to 55 000 depending with the variety, time of planting, agro-ecological region, intended purpose
 e.g fodder or green mealies
- Plant spacing 25 30cm between plants and 80 100cm between rows.

When spraying, approximately 12.5 * 16 litre knapsacks will cover 1 hectare. That makes 200 liters. IT IS ADVISABLE THAT SOIL TESTS BE DONE BEFORE PLANTING.

Rainfed crop: December – January, Irrigated crop: August - September

CLIMATIC REQUIREMENTS

- Grows best at day temp. range 21-25 degrees celcius & night range 8-20 degrees celcius
- Tomatoes can be grown all year round in frost free areas.

SOIL CONDITIONS

- · But best results are obtained in deep, well-drained loams, the soil should be rich in organic matter and plant nutrients
- pH value of 5.8 to 7

PLANT POPULATION AND SPACING

- Use spacing of 1.2 2 m between, rows and 30 50 cm within rows.
- Seeds requirement of 120 160g per Ha
- Expected yield: 25 40 tonnes per Ha
- With higher fertilization rates and good agronomic practices yields can go up to 100 tonnes per Ha

When spraying, approximately 12.5 * 16 litre knapsacks will cover 1 hectare. That makes 200liters.

IT IS ADVISABLE THAT SOIL TESTS BE DONE BEFORE PLANTING.

|--|---------------------------------------|-------------------------|--|
| TUTA ABSOLUTA | Villa Addition (Indoxacarb) | 250-300mL | Apply in 200 litres of water and repeat as necessary |
| (LEAF MINER) BOLLWORMS | Villa Lambda 50 EC | 200-250mL | Apply as soon as you notice symptoms and apply on 7 days intervals |
| CUTWORMS | Villa Methomyl 90 SP Tamron 585 SL | 225-250mL 500-1000mL | Apply as full cover spray Start spraying at flowering time and repeat every 7 to 14 days, as long as |
| à. | Emamectin benzoate | 150-200g | these pests remain active. Apply during first incidence of larvae and repeat as necessary |
| | Delta-thrin (Deltamethrin) | 300 mL | Apply in 7 to 10 days intervals as necessary |
| | Acephate | 400-800g | Repeat at 7 to 10 days spray intervals as necessary to maintain control |
| | Spinosad (Trinosad 480 SC) | 200-300mL | Apply at 7 to 10 days intervals as necessary |
| NEMATODES | Oxamyl, Nemacur 400EC / Fenamiphos | 2 - 3L | Apply to the land prior to transplanting at any time from two weeks before until immediately before transplanting. |
| RED SPIDER MITES | Villa Savage (Chlorfenapyr) | 350-700mL | Apply as a high volume, high pressure, full cover spray, at first signs of |
| THRIPS AND SEMI LOOPERS | Metamidophos (Tamron 585 SL) | 500-1000mL | infestation and repeat as necessary. Start spraying at flowering time and repeat every 7 to 14 days, as long as |
| | Dichlorvos 1000 EC | 200-400mL | these pests remain active. Apply as a full cover spray when the pest is noticed. Repeat as necessary. |
| FRUIT FLY APHIDS WHITE FLY, GRUBS AND | Imidacloprid/Imirod 350 SC | 0.05mL per plant | Only for use on tomatoes in enclosed areas (e.g. glasshouses, tunnels, etc.). Apply as a soil drench 24 hours after transplanting. |
| HOPPERS | Thiaxam 250 WDG | 0.03g per plant | Apply as a soil drench around the stem base in 50 ml water per plant at transplant or shortly afterwards. |

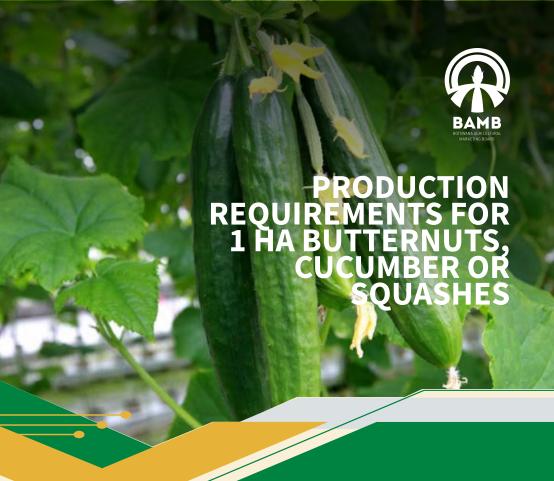

^{*}THIS IS A RECOMMENDATION*

• Plant as soon as danger of frost is past and soil temperatures are above 180 C, up to February.

CLIMATIC REQUIREMENTS

• Optimum temperature ranges for production are 18 - 21 at night and below 29 degrees Celsius during the day therefore restricting production to summer

SOIL CONDITIONS

• Butternuts can be grown on a wide range of soils, fertile soils with adequate drainage are preferable, ideal soils are sandy loams or silty loams which warm up rapidly

PLANT POPULATION AND SPACING

- Spacing for basin method, 3.0 3.6 m apart.
- Rows, 2.0 3.5m between rows and 1.0 2.0 m within the row.
- Population variable but about 10 000 15000 plants per ha.
- Seed requirement of 2 4kg per Ha depending on seed size and spacing

When spraying, approximately 12.5 * 16 litre knapsacks will cover 1 hectare. That makes 200liters.

IT IS ADVISABLE THAT SOIL TESTS BE DONE BEFORE PLANTING.
